

raftra – Setup for Google Login & Password Reset

Step-by-step, using your own Google and email accounts.

Before you start: you also need two values in **backend/.env** – a **DATABASE_URL** (ask the project owner, or use your own database) and a **JWT_SECRET_KEY**. Generate a JWT secret by running:

```
python -c "import secrets; print(secrets.token_urlsafe(64))"
```

Part 1 – Google Login (create your own Google app)

A. Create a Google Cloud project

- 1 Go to <https://console.cloud.google.com> and sign in.
- 2 Top bar → project dropdown → **New Project** → name it **raftra** → **Create**.

B. Set up the consent screen

- 1 Left menu → **APIs & Services** → **OAuth consent screen**.
- 2 Choose **External** → **Create**.
- 3 Fill in **App name** (raftra), **User support email** (your email), **Developer contact email** (your email) → **Save and Continue**.
- 4 On "Scopes" → just **Save and Continue**.
- 5 On "Test users" → **+ Add Users** → add **your Gmail** (and anyone who will test) → **Save and Continue**.

C. Create the login credentials

- 1 Left menu → **APIs & Services** → **Credentials**.
- 2 **+ Create Credentials** → **OAuth client ID**.
- 3 Application type: **Web application**. Name: **raftra web**.
- 4 Under **Authorized redirect URIs** → **+ Add URI** → paste exactly the URL shown below.
- 5 Click **Create** → Google shows a **Client ID** and **Client Secret** → copy both.

```
http://localhost:8005/api/auth/oauth/google/callback
```

D. Put them in backend/.env

```
GOOGLE_CLIENT_ID=your-client-id-here
GOOGLE_CLIENT_SECRET=your-client-secret-here
```

Save and restart the backend. Google login now uses **your** app. Because it is in "Testing" mode, only the emails you added as Test Users (step B5) can log in.

Part 2 – Password Reset (your own sending email)

A. Turn on 2-Step Verification

- 1 Sign in to the Gmail you want to send from.
- 2 Go to <https://myaccount.google.com/security> → **2-Step Verification** → **Turn on** → enter your phone number → type the SMS code.

B. Create an App Password

1Go to <https://myaccount.google.com/apppasswords> (appears only after step A).

2Type a name **raftra** → **Create** → copy the **16-character** code → **remove the spaces**.

C. Put it in backend/.env

```
SMTP_HOST=smtp.gmail.com
SMTP_PORT=587
SMTP_USER=your-gmail@gmail.com
SMTP_PASSWORD=the16charapppassword
SMTP_FROM=your-gmail@gmail.com
```

Save, restart the backend, and test "**Forgot password**" – the email should arrive (check Spam the first time).

Leave these as-is (local defaults)

```
FRONTEND_URL=http://localhost:5173
BACKEND_URL=http://localhost:8005
CORS_ORIGINS=http://localhost:5173,http://127.0.0.1:5173
```

After both parts, Google login and password reset run entirely on your own accounts – no shared credentials needed.
